

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1.     **(previously presented)**     An integrated apparatus for optically monitoring a semiconductor workpiece for process control in a semiconductor production process, said apparatus comprising:

    a supporting assembly for supporting said workpiece; and

    an optical monitoring unit positioned opposite a surface of said workpiece and separated therefrom by an optical window, wherein said optical monitoring unit is mounted for reciprocating movement within a plane parallel to said window for monitoring at least one desired parameter of said semiconductor workpiece and has pattern recognition and auto-focusing capabilities;

    wherein said optical window comprises a plurality of relatively small window fragments located in pre-determined locations to enable observation of desired pre-determined portions of said workpiece; and

    wherein the size and shape of said window fragments are selected according to requirements of transparency in a pre-determined spectral range, mechanical strength and ability of pattern recognition and auto-focusing.

2.     **(previously presented)**     The integrated apparatus according to claim 1, wherein said desired portions of the workpiece include the center and part of the edge of said workpiece.

3.     **(previously presented)**     The integrated apparatus according to claim 2, wherein at least one of said optical window fragments is of a shape of a sector of a circle.

4.     **(previously presented)**     The integrated apparatus according to claim 2, wherein at least one of said optical window fragments is of a rectangular shape.

5.     **(previously presented)**     The integrated apparatus according to claims 4, wherein said window fragments comprise at least one window fragment having a strip shape bent around the edge of the workpiece.

6.     **(previously presented)**     The integrated apparatus according to claim 1, wherein said optical monitoring unit comprises a spectrophotometer.

7.     **(previously presented)**     The integrated apparatus according to claim 1, wherein said optical monitoring unit comprises an ellipsometer.

8.     **(previously presented)**     The integrated apparatus according to claim 1, wherein said semiconductor workpiece is a wafer.

9.     **(previously amended)**     The integrated apparatus according to claim 1, wherein said workpiece has an axis of symmetry, and said supporting assembly is mounted for substantially slow rotation.

10.    **(currently amended)**     A method of optically monitoring a semiconductor workpiece having an axis of symmetry for process control in a semiconductor production process, said method comprising ~~the steps of:~~

optically scanning the workpiece using a movable optical unit through an optical window

comprising a plurality of relatively small fragments located in pre-determined locations to enable observation of desired portions of the workpiece, the size and shape of said fragments being selected according to requirements of transparency in a pre-determined spectral range, mechanical strength and ability of pattern recognition and auto-focusing; and

defining at least one desired parameter of said semiconductor workpiece at said desired portions of the workpiece.

11. **(previously presented)** The method according to claim 10, wherein said desired portions of the workpiece include the center and part of the edge of said workpiece.

12. **(previously presented)** The method according to claim 10, further comprising rotation of said workpiece by a pre-determined angle.

13. **(previously presented)** The method according to claim 10, wherein said optical scanning includes pattern recognition and autofocus.

14. **(previously presented)** The method according to claim 10, wherein said workpiece has a multi-layer structure and said at least one desired parameter is a thickness of at least one of the layers of said workpiece.

15. **(previously presented)** The method according to claim 14, wherein said optical scanning includes measuring spectral characteristics of light response of the scanned portions of the workpiece.

16. **(previously presented)** An apparatus for optically monitoring a semiconductor workpiece in a semiconductor production process, said apparatus comprising:  
a chamber defining a measuring area and having on a wall thereof an optical window;

a support disposed inside said chamber for supporting said workpiece; and  
an optical monitoring unit disposed outside said chamber and facing a surface of said workpiece and separated therefrom by said optical window, said optical monitoring unit being moveable relative to said support for monitoring at least one parameter of said semiconductor workpiece;

wherein

said optical window comprises at least one window fragment located at a predetermined location corresponding to a predetermined portion of said workpiece where said at least one parameter is to be monitored;

an entire area of said at least one window fragment is smaller than an entire area of said workpiece;

said window fragment is made of a material transparent to wavelengths in a spectral range used by said optical monitoring unit and has a mechanical strength sufficient to sustain a pressure difference between pressures inside and outside said chamber.

17.     **(previously presented)**     The apparatus of claim 16, wherein said chamber is a vacuum chamber in CVD equipment and said workpiece is a wafer.

18.     **(previously presented)**     The apparatus of claim 16, comprising multiple said window fragments, wherein a sum of entire areas of all said window fragments is smaller than the entire area of said workpiece.

19.     **(previously presented)**     The apparatus of claim 18, wherein  
said optical monitoring unit is mounted for reciprocating movement within a plane parallel to said window; and  
said support is rotatable about an axis.

20. **(previously presented)** The apparatus of claim 19, wherein said windows fragments are arranged to cover all desired portions of said workpiece where said at least one parameter is to be monitored so that said at least one parameter can be determined at all desired portions of said workpiece in a single scanning action without additional relative rotational movement between said optical monitoring unit and said support.

21. **(previously presented)** The apparatus of claim 18, wherein at least one of said windows fragments has a shape of a sector of a circle having a radius greater than a radius of said workpiece which is a wafer.

22. **(previously presented)** The method of claim 10, wherein, in said scanning step, said movable optical unit scans only predetermined portions of a surface of said workpiece, which is a semiconductor wafer, without scanning an entirety of said surface of said semiconductor wafer.
